

Repeated Code

- We had components that would come up several times, and we simply repeated the code over and over.
 - Refactored into smaller components
 - Easy to implement and use several times
 - Cleaner code

Lack of Error Handling

- None of the input fields had error handling, meaning the user could input anything and potentially break the system.
 - Implemented it, ensuring the user was forced to fill all fields properly before sending info to the database

Inconsistent styling

- Each page looked different, with UI that looked a little bit different in each page, making our software look less cohesive
 - Revamped all the UI to ensure a clean and seamless experience between pages
